

the 1990s, the number of people in the UK who are employed in the public sector has increased by 1.5 million (1990–1999) and is projected to increase by a further 1.5 million by 2010 (HM Treasury 2000).

There is a growing emphasis on the need to improve the efficiency of public sector organisations and to ensure that the public sector is able to deliver the services that are required by the public in a cost-effective manner. This has led to a number of initiatives aimed at improving the efficiency of public sector organisations, including the introduction of performance indicators and the implementation of cost-cutting measures.

One of the key challenges facing public sector organisations is the need to reduce costs while maintaining the quality of services. This is a difficult task, as public sector organisations are often faced with a number of constraints, including limited budgets and the need to provide a wide range of services to the public.

One of the ways in which public sector organisations can reduce costs is by improving the efficiency of their operations. This can be achieved by a number of measures, including the implementation of lean management principles and the use of technology to streamline processes.

Another way in which public sector organisations can reduce costs is by improving the efficiency of their procurement processes. This can be achieved by a number of measures, including the use of competitive tendering and the implementation of framework agreements.

Finally, public sector organisations can also reduce costs by improving the efficiency of their human resources. This can be achieved by a number of measures, including the implementation of performance management systems and the use of flexible working arrangements.

There are a number of challenges facing public sector organisations in the future, including the need to continue to improve the efficiency of their operations and to ensure that they are able to deliver the services that are required by the public in a cost-effective manner.

the 1990s, the number of people in the world who are obese has increased by 100% (World Health Organization 2000). The prevalence of obesity in the United States has increased from 15% in 1980 to 23% in 1994 (Flegal et al. 1994). In the United Kingdom, the prevalence of obesity has increased from 10% in 1980 to 15% in 1994 (Rees et al. 1995). The prevalence of obesity in the United States is expected to increase to 30% by the year 2010 (Flegal et al. 1994).

Obesity is a risk factor for a number of chronic diseases, including coronary heart disease, stroke, type 2 diabetes, and certain types of cancer (World Health Organization 2000). Obesity is also a risk factor for a number of mental health problems, including depression, anxiety, and eating disorders (Rees et al. 1995). Obesity is a complex condition that is caused by a combination of genetic, environmental, and behavioral factors. The following are some of the factors that are thought to contribute to the development of obesity:

1. Genetic factors: Obesity can be inherited. If one or both parents are obese, their children are more likely to be obese.
2. Environmental factors: Obesity is more common in people who live in environments where there is a high availability of high-calorie, high-fat foods and where there is a low level of physical activity.
3. Behavioral factors: Obesity is more common in people who eat a diet that is high in calories and fat and who do not exercise regularly.
